

SNOMED ONLY
By: Nancy Vining Van Ness

In some instances on the Cypress Meaningful Use Stage 2 test, codes from several code systems will meet the requirements. There are significant numbers of exceptions to that where codes from a single code system are the only option. Below is an analysis of the code lists on the Ricky Todd test patient that only include SNOMED codes.

The Ricky Todd test patient was generated by the Cypress version 1.1 QRDA test. It included all EP and EH measures. Beginning with Cypress 1.2, all of the data elements will be distributed across a number of test patients instead of occurring in one clinically improbable one. The composite test patient did, however, allow comprehensive analysis of the elements of the test.

What follows are the SNOMED codes that were the only codes which meet the test requirement and the Code Lists from which they are drawn found on the Ricky Todd test patient record. Some of these specific codes appeared more than one time, and of those some figured in more than one code list.

This analysis shows the status of the code lists on the Ricky test patient record in the code lists for Cypress 1.2, the revised one. There are 13 fewer code lists in this version; some of the code lists found on Ricky are not included among the new ones and are noted.
