

ENTRIES WITH ONLY SNOMED CODES FOR TEST PATIENT RICKY TODD

By: Nancy Vining Van Ness

Below are entries from the Cypress Ricky Todd test patient record in order of the numbered Encounters (1 -73) where the only code that would meet the requirements for certification is a SNOMED-CT code. This test patient was one designed to allow the EHR to be tested for all of the measures, which made for some improbable situations. The newest version of Cypress does not use these composite patients, but rather a series of more probable ones. Some of them will also be used to test more than one measure, but not all of the measures.

Test patients like Ricky Todd allow us to make a comprehensive analysis of the testing procedure.

A last note before the data itself is that some of the SNOMED codes are found in the Fields column of the Ricky test patient record. These are almost all SNOMED codes that will need to be dealt with in the course of the certification testing.

The test patient record from the Cypress site which is the source of the information in this table was one that allowed an EHR to be tested for all the inpatient and outpatient measures of the Meaningful Use Stage 2. The outcry from practitioners in particular led to Cypress making changes. The measures will now be tested separately using a number of test patient records, some of which are used for more than one measure appropriate to the characteristics of the individual test patients

Codes from the code lists on this test patient record will occur on the revised test patient records. They will not all appear on one record but all of them will occur in the total for the whole group. They will have to be successfully entered for Meaningful Use Stage 2.
